

## Disease name

# RABBIT HAEMORRHAGIC DISEASE

### Reference Expert name

**Lorenzo Capucci**

Address of laboratory : Istituto Zooprofilattico sperimentale della Lombardia ed Emilia Romagna

Address continued: via Bianchi 9, 25124 Brescia - Italy

Tel.: (0039 030 2290 308), Fax: (0039 030 2290 559)

e-mail address [lcapucci@bs.izs.it](mailto:lcapucci@bs.izs.it) , website of the Institute: <http://www.bs.izs.it>

## Summary of general activities related to the disease

### 1. Test(s) in use/or available for the specified disease at your laboratory

#### Virological Tests

*Tests used for routine diagnostic work:*

- Sandwich ELISA test using RHDV specific Monoclonal Antibody (MAb). A similar test using specific EBHSV MAbs is used for diagnosis of EBHS.
- Sandwich ELISA test using a panel of RHDV specific MAbs. This test permits the quick detection of antigenic RHDV variants. It also includes MAbs produced and specific for the first consistent antigenic variant of RHDV (subtype RHDVa) and therefore it allows an easy and quick distinction between such variant and "classical" RHDV strains.
- Western Blot Analysis using RHDV-MAbs cross-reactive with EBHSV. It is usually performed on the few samples, which give doubtful results in ELISA test, in animals died due to the "chronic" form of the disease and in which the presence of specific antibodies interfere with the ELISAs test. The analysis is usually performed on samples previously concentrated by ultracentrifugation, both on the pellet and on the supernatant.

*Additional Tests used for particular investigations:*

- Reverse transcription Polymerase Chain Reaction (RT-PCR).
- Negative staining ImmunoElectronMicroscopy and ImmunoGold using both MAbs and rabbit and hare hyperimmune sera.
- Haemoagglutination tests

#### Serological Tests

*Tests used for routine diagnostic work:*

- Competition ELISA; two different tests, based on specific MAbs used as tracer, have been set up respectively for RHDV and EBHSV.
- ELISAs developed using antisotype MAbs to test the sera for the presence of specific anti-RHDV IgM, IgA and IgG.

*Additional Tests used for particular investigations:*

- Indirect ELISA with the purified RHDV adsorbed to the solid phase.
- Sandwich Elisa to detect IgM and IgG in liver or spleen samples already examined with the virological test. Such test is particularly useful in those animals, which die due to the "chronic" form of the disease, when the detection of the virus could be difficult. In this case, a high level of RHDV specific IgM and a low level, if any, of IgG are the unambiguous marker of positivity for RHD.

<b>Test</b>	<b>For</b>	<b>Specificity</b>	<b>Total</b>
ELISA	Antibody	RHDV	833
ELISA	Antibody Isotypes (IgM or IgA or IgG)	RHDV	1570
ELISA	Antibody	EBHSV	1039
ELISA	Antigen	RHDV	215
ELISA	Antigen	EBHSV	766
Western blotting	Antigen	RHDV/EBHSV	6

## 2. Production and distribution of diagnostic reagents

- RHDV MAbs,
  - EBHSV MAbs
  - RHDV semipurified antigen "BS89 classical strain"
  - RHDV semipurified antigen "RHDVa" variant strain
- Anti-RHDV and anti-EBHSV hyperimmune sera

ELISA reagents for virological and serological diagnosis of RHD and European Brown hare syndrome (EBHS), including internal ELISA controls (negative and positive) sent as "kit".

Kit for	supplied nationally
Serology RHD	11
Serology EBHS	28
Virology RHD/EBHS	40

Kit for	supplied to other OIE Member Countries
Serology RHD	10
Serology EBHS	22
Virology RHD/EBHS	6

### Activities specifically related to the mandate of OIE Reference Laboratories

#### 3. International harmonisation and standardisation of methods for diagnostic testing or the production and testing of vaccines

No activity on this item.

#### 4. Preparation and supply of international reference standards for diagnostic tests or vaccines

Nowadays the laboratory does not prepare or possess internationally recognised standard RHD rabbits sera but it prepares and supplies own panel of reference RHD sera to use as standard in the evaluation of diagnostic test. We sent one panel of sera to a laboratory of a OIE Member Country to verify the level of performance of its RHD serological test. In addition, answering to request received at the end of 2006, we are going to send two more panels of sera to others two countries that will use the sera to standardize their own methods,. This should be the first step towards the production of internationally recognised standard reference sera, likely within 2007.

#### 5. Research and development of new procedures for diagnosis and control

The Italian Ministry of Health supports a research program on RHDV devoted to the standardization of a set of different PCR (different targets and methods including nested and real time PCR) to use to improve the diagnosis and in studies of molecular epidemiology and pathogenesis. The research is in the course and the final results are expected for the end of 2007.

It has been completed a field trial for evaluating the potency of a RHD inactivated vaccine prepared using both the classical and the variant strain of RHDV. This vaccine was developed in order to confer a stronger level of protection to rabbits since the epidemiological and diagnostic results are indicating that most (around 65%) of the RHD outbreaks are caused by variant strains

**6. Collection, analysis and dissemination of epizootiological data relevant to international disease control**

In the course of 2006, we had not registered any significant epidemiological or virological data different from those of previous years. Considering the reduced commercial interest on rabbits and the success of vaccine in the control of the disease, few countries carry out a minimum of surveillance on RHD. Some more interest is on the wild rabbits, particularly in Australia where the goal is to keep RHDV active as much as possible or, for opposite reasons, in country where rabbits are among the main hunting target (i.e. Spain and French). From a scientific point of view, the main data came from the use of high sensitive PCR (real time or nested) in different experimental and epidemiological situations. Using these methods, the RHDV or RHDV-like genome is often found also in animal not apparently involved in RHD outbreaks. These findings, due probably to the presence of viruses/strains RHDV related but not pathogen, may create problems in the diagnosis and control of RHD and therefore must be clarified coupling high sensitive PCR with well designed and reproducible experimental project.

We have continued to study the distribution and diffusion of the RHDVa variant in Italy and we found that almost 57% of the cases of RHD occurred in the last year were caused by such variant.

**7. Provision of consultant expertise to OIE or to OIE Member Countries**

No activity on this item this year; we completed during 2005 the revision of the chapter on RHDV for the 6<sup>th</sup> edition of the Manual and we are now waiting for the comments.

**8. Provision of scientific and technical training to personnel from other OIE Member Countries**

The laboratory took in for four weeks a post doc from Poland (University in Szczecin) in order to improve her knowledge on RHDV diagnosis and research methods. The guest had the opportunity to learn on and use the main ELISA methods and to train with the basic PCR principles and methods.

The laboratory took in for two days an Australian colleague in order to thoroughly discuss the results obtained and possible further lines of research on RHD.

The laboratory took in for two days a Dutch colleague for discussion on epidemiology of RHD in free ranging rabbits and the use of diagnostic methods for detection non pathogenic RHDV-like viruses.

**9. Provision of diagnostic testing facilities to other OIE Member Countries**

We did not receive any kind of request for the direct RHD diagnosis (virological identification or confirmation). We performed serological analysis, correlated to epidemiological studies, following requests of laboratories from French, Greece, The Netherlands and Australia (a study an hare sera to look for presence of RHD related antibodies).

**10. Organisation of international scientific meetings on behalf of OIE or other international bodies**

No activity on this item.

**11. Participation in international scientific collaborative studies**

A collaborative study is in the course with Australian laboratories in order to improve the knowledge on the epidemiological and virological evolution of the RHD in the country.

A similar collaborative study is in the course with French laboratories in order to improve the knowledge on the epidemiological presence and diffusion of RHDV and RHDV-like non-pathogenic viruses among wild rabbits in the country.

Another collaborative study is in the course with a Dutch university in order to improve the knowledge on the epidemiological presence and diffusion of RHDV and RHDV-like non-pathogenic viruses among wild rabbits in The Netherlands.

Another study is the course with French laboratories in order to improve the knowledge on the control of EBHS and the genomic and antigenic evolution of the virus in France and Italy.

**12. Publication and dissemination of information relevant to the work of OIE (including list of scientific publications, internet publishing activities, presentations at international conferences)**
